Since homogeneous boundary conditions are still required, boundary conditions are dissipative. Example 4. Mixing motion driven by an agitator. Another example of fluid motion is of concern here, because it represents yet another way of imposing of boundary conditions on the system discussed in this report. It is assumed that on a circumference of a square domain T , no-slip and no-penetration boundary conditions are imposed. At the center of the domain, at centers of some centrally-located cells, a sinusoidal variation of vorticity is required. This emulates a motion of a square agitator impeller of a mixer. The dissipative nature of boundary conditions is probably a result of the separation of energy principles for the vorticity and stream functions along some unspecified flow line. This can also be discussed using straightforward physical arguments. Consider the term: $(2.45) \epsilon u, (-v_y, v, n_y)$. In agreement with already introduced formulas, we...

Reviews

This book is definitely worth acquiring. I have gone through and so I am certain that I will likely to read through again in the future. It's been printed in an exceptionally basic way in fact it is only after I finished reading this publication in which actually altered me, change the way in my opinion.
