The aim of this work is, first of all, to place in a clear light the theory and relations of Graphic and Analytic Statics; and, then, to illustrate their practical application to the treatment of stress in the familiar forms of iron and wooden frameworks. Part I. deals with the fundamental principles of Graphic Statics, in which each proposition is proved, step by step, by the sole aid of pure geometry, without consciously leaving any serious gaps in the demonstrations to distress and discourage beginners. Part II. comprises the dual treatment of roof and bridge-structures by graphic and analytic methods; where results, formerly obtained by analytical calculation, are deduced in their analytical shape from the forms and relations existing in the graphic diagram. These new graphic demonstrations of familiar formulae will be found to agree with those analytically determined by Rankine and Bresse in various parts of their works on Applied Mechanics. Another special feature of the Second Part is the treatment of a given roof or bridge by two methods which mutually check and corroborate each other.
